# The Rise in Antibiotic Resistance is Inciting a Global Public Health Crisis

In 2013, the US Centers for Disease Control declared antibiotic resistance as one of the nation's most serious health threats:

- 2 million people per year in the US acquire serious antibiotic resistant infections.
- At least 23,000 people each year die as a direct result of these infections.
- Many more die from complications caused by the antibiotic resistant infection.
- Antibiotic resistant infections prolong hospital stays and add considerable cost to the healthcare system:
  - ✧ \$20 billion a year in excess direct healthcare costs
  - ✧ \$35 billion a year in indirect cost (eg. loss of productivity at work)

Biofilm forming  
*Staphylococcus epidermidis*

- Drug-resistant *Staphylococcus aureus* (MRSA) causes both hospital- and community- acquired infections. In 2011:
  - ✧ caused 80,461 severe hospital-acquired infections
  - ✧ 11,285 of these resulted in death
- *Staphylococcus epidermidis* is the most common cause of drug-resistant infections associated with medical implants (ie. cardiac devices, prosthetic joints; CNS shunts, catheters etc.)
- Today there exist Staphylococcal strains that are resistant to all known antibiotics

# Bacterial viruses (aka Phages): Alternatives to antibiotics

**Erwinia phages.** Born *et al*, *App and Env Eng*, 2011

- Bacterial viruses (bacteriophages) are the most abundant entities in the biosphere.
- In terrestrial and aquatic environments, phages outnumber their bacterial prey by a factor of 10.
- Many are lethal to their bacterial hosts.
- “Phage Therapy” was commonly used to treat infections prior to the advent of antibiotics, and still practiced today in parts of Eastern Europe.
- Currently a renewed interest in using phages or their products as alternatives to antibiotics.

# Enlisting Bacterial Viruses to Combat Drug Resistant Staphylococci

- Fishing for Phages at the Tuscaloosa Wastewater Treatment Plant:

- Novel *Staphylococcus epidermidis* viruses isolated from Tuscaloosa wastewater:

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

-> Which phage is more effective in bacterial killing (Myophage ISP or Podophage Andhra?)

-> No examples of *S. epidermidis* podophages have been reported, but we observed larger “plaques” on bacterial lawn:

-> Hypothesis: Podophage Andhra is more effective in bacterial killing than Myophage ISP.

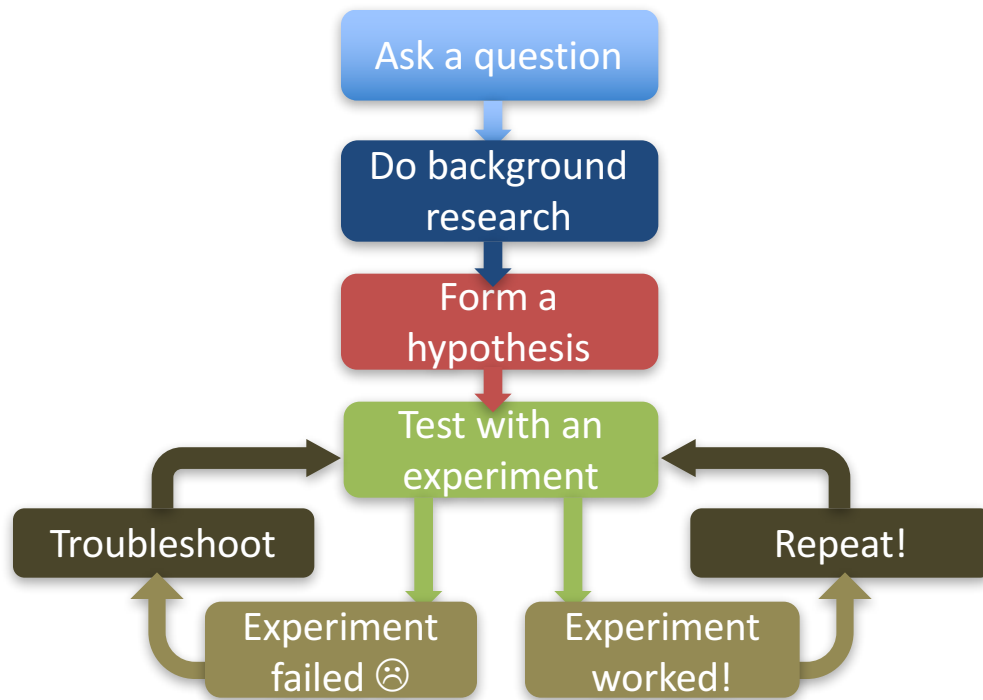

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

-> Designed a “phage challenge” experiment – bacteria grown in liquid culture and  $1 \times 10^7$  phage particles are added after 2h.

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

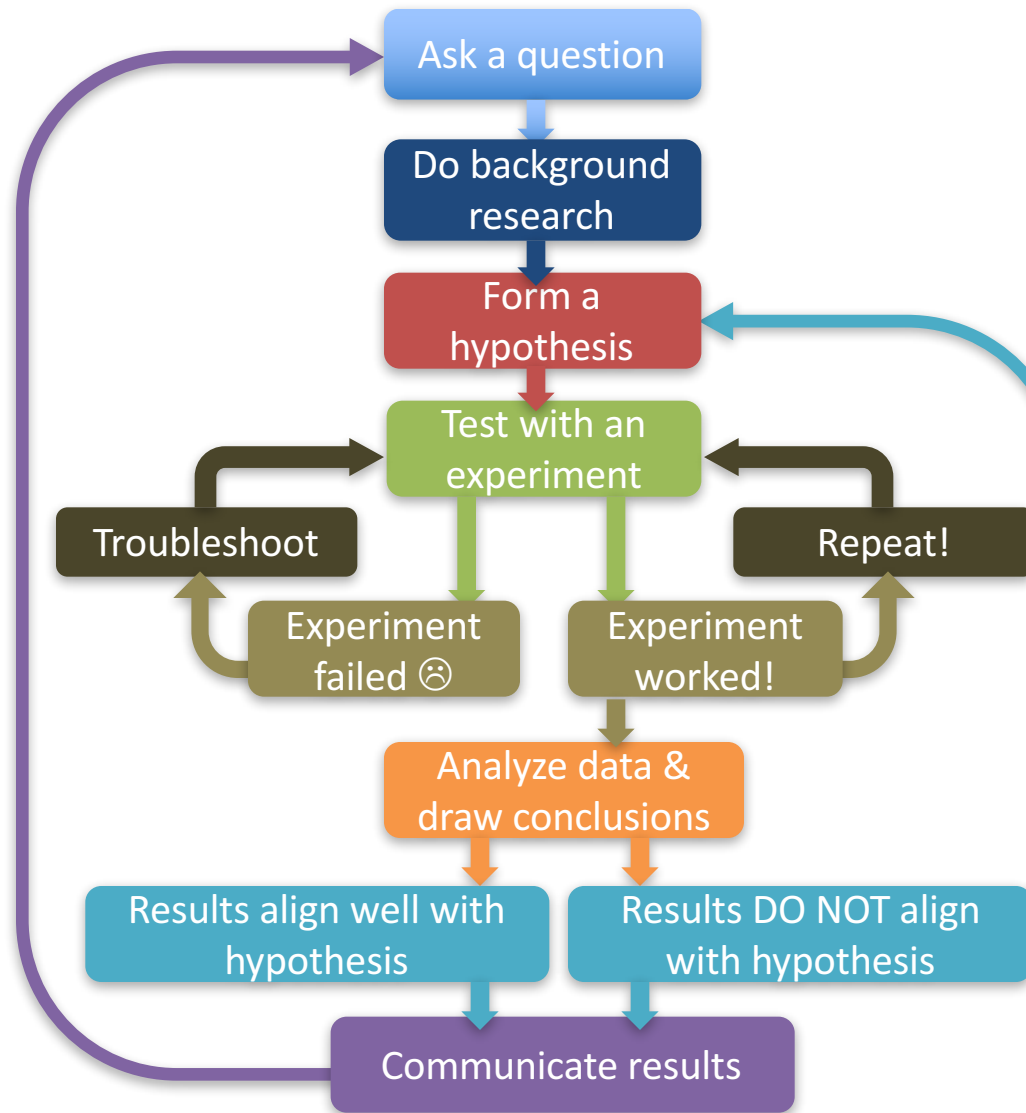

-> Designed a “phage challenge” experiment – bacteria grown in liquid culture and  $1 \times 10^7$  phage particles are added after 2h.

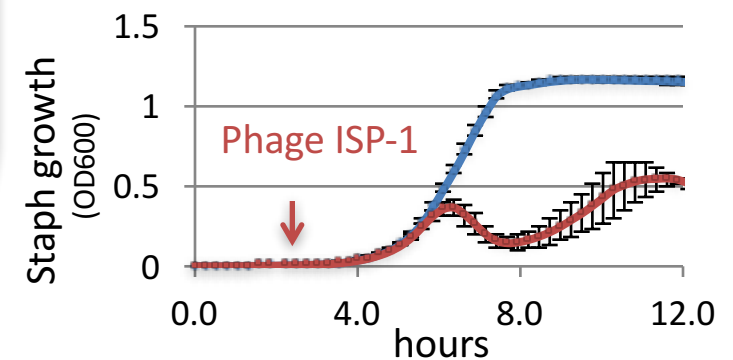

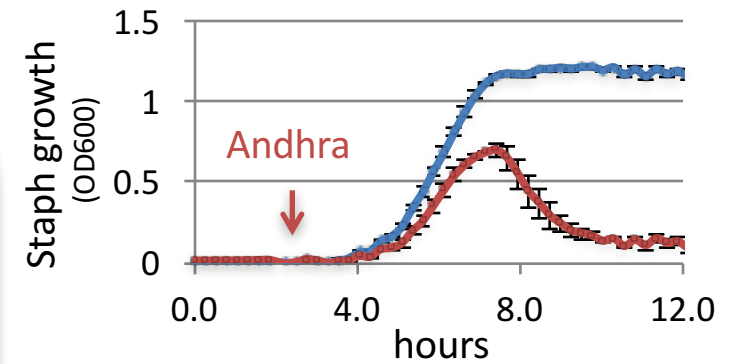

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

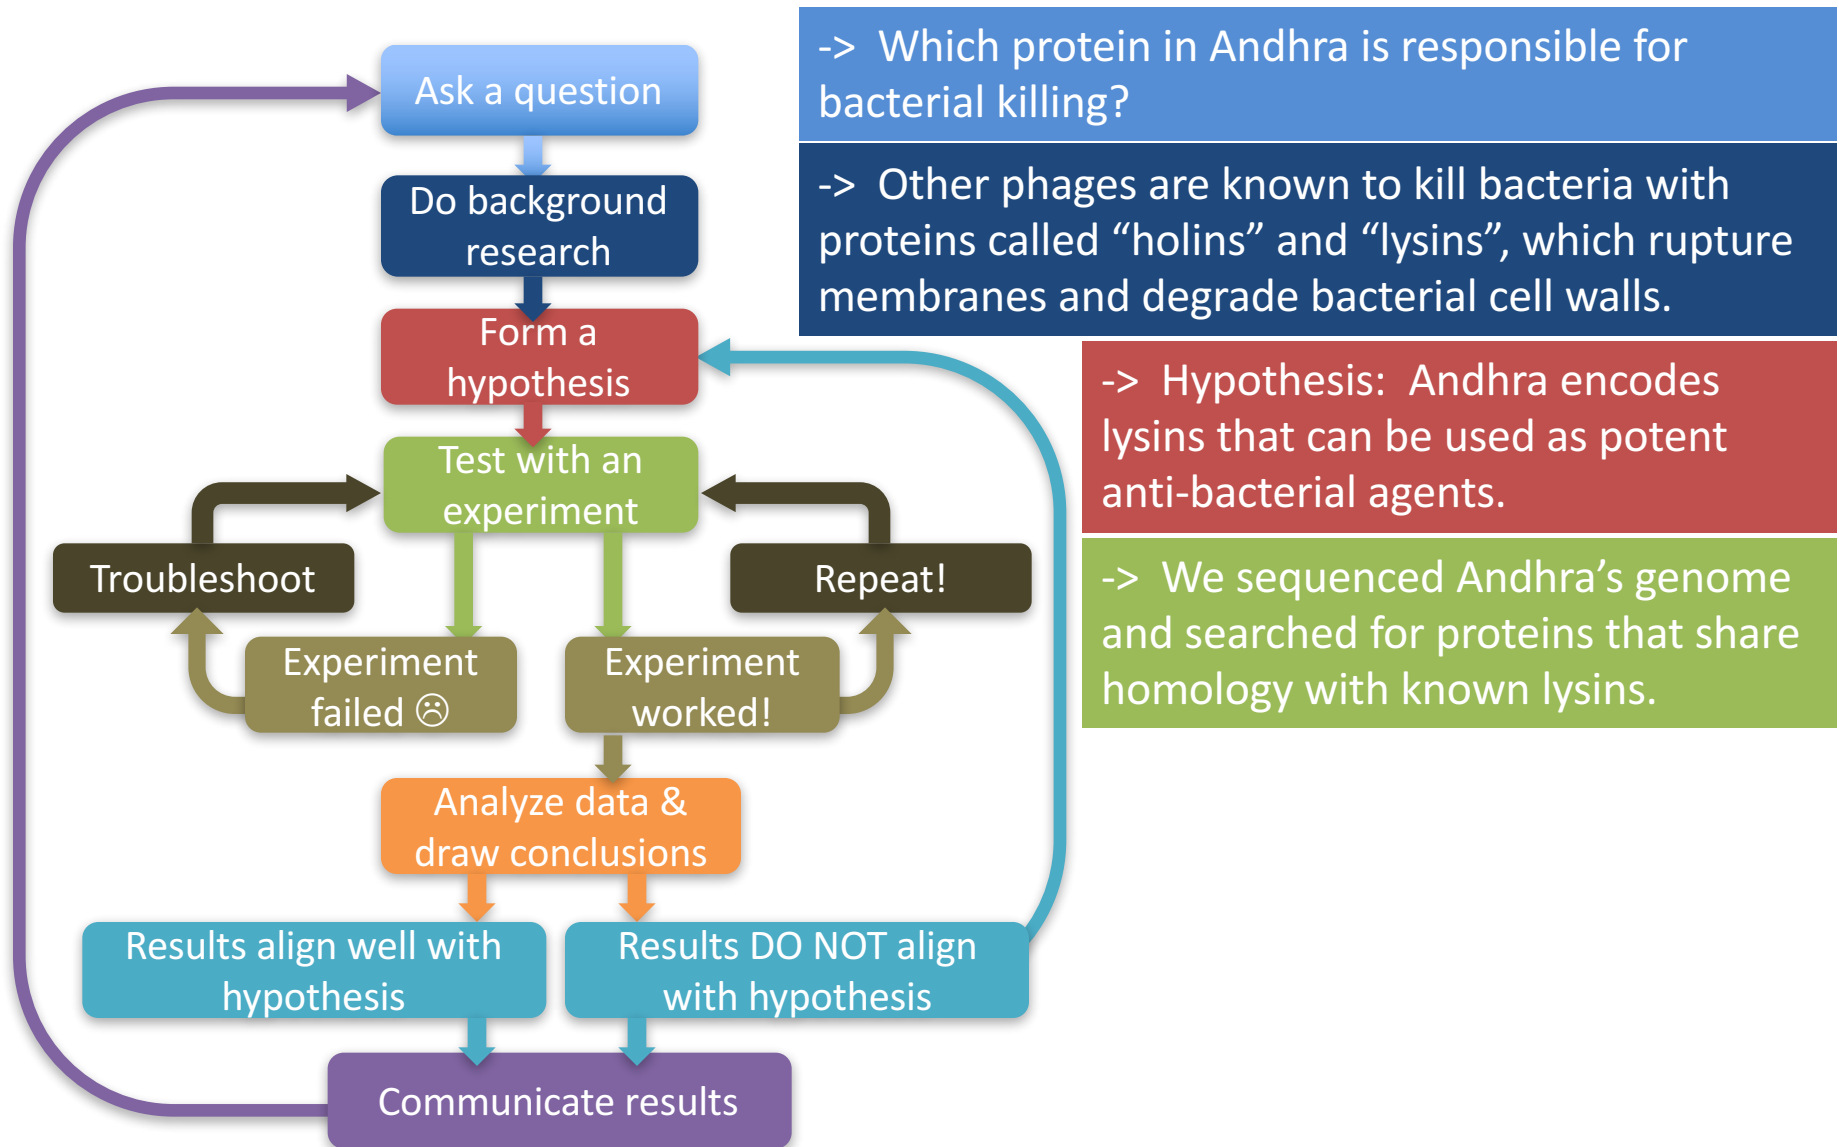

-> Designed a “phage challenge” experiment – bacteria grown in liquid culture and  $1 \times 10^7$  phage particles are added after 2h.

-> Andhra appears to kill *S. epidermidis* more effectively than ISP.

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

# Phage Andhra Genome

## Andhra genome characteristics:

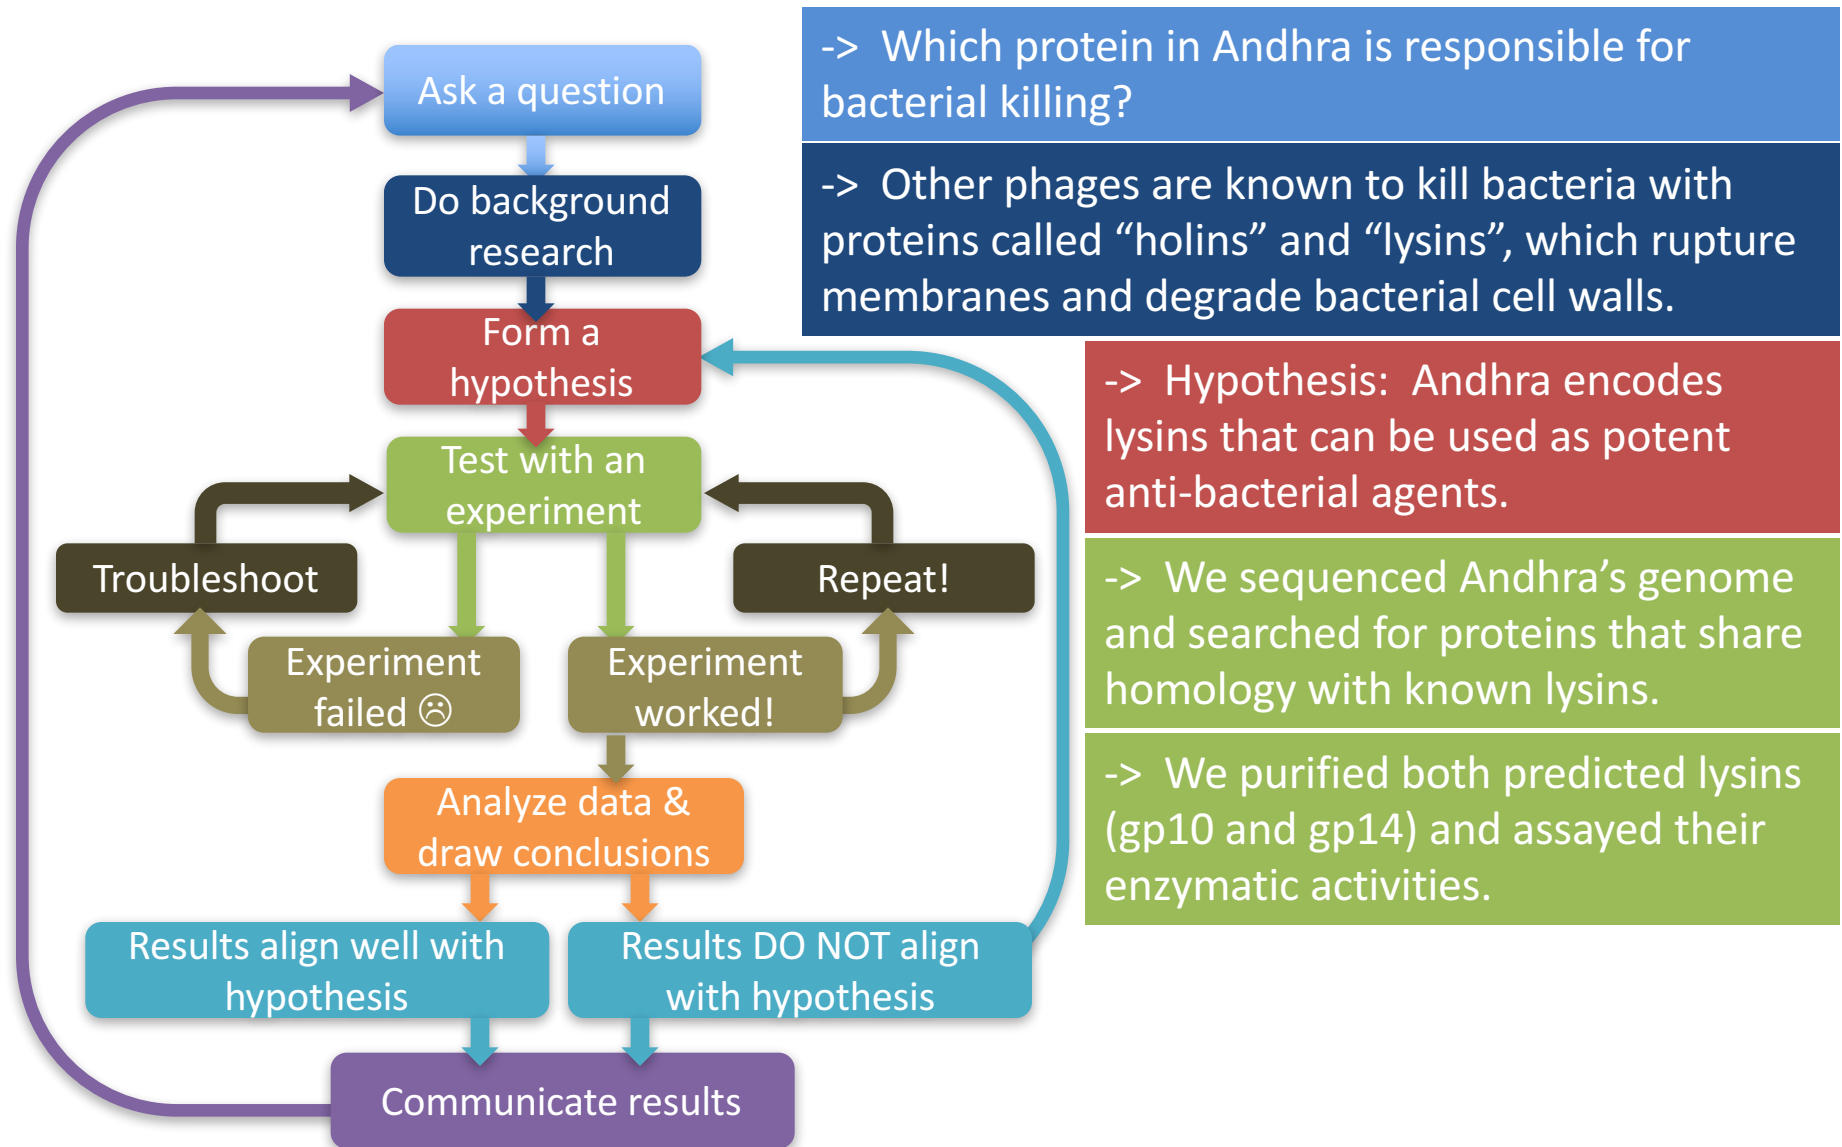

- linear, double-stranded DNA
- 18,546 base pairs
- 20 genes
- 45% of genes have unknown function

## Andhra genome schematic:

\* gp = gene product; gp10 and gp14 are predicted lysins

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

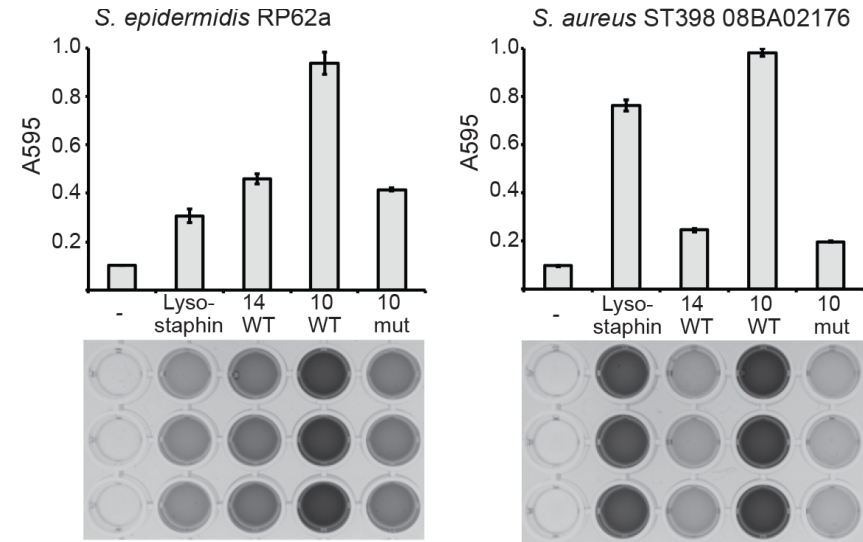

# Purification and characterization of Andhra's gene products 10 and 14

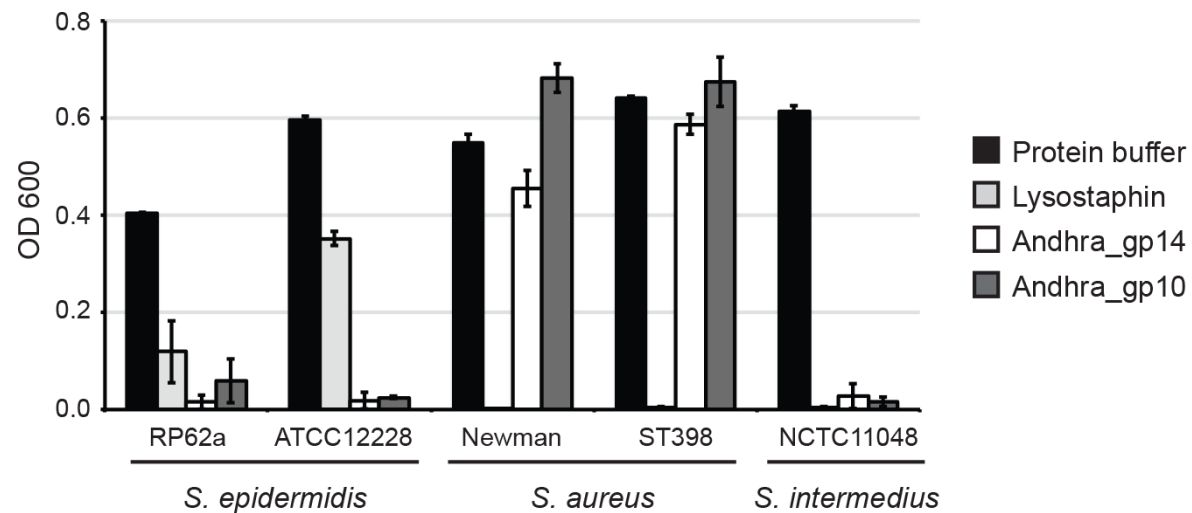

## 1. Purified proteins:

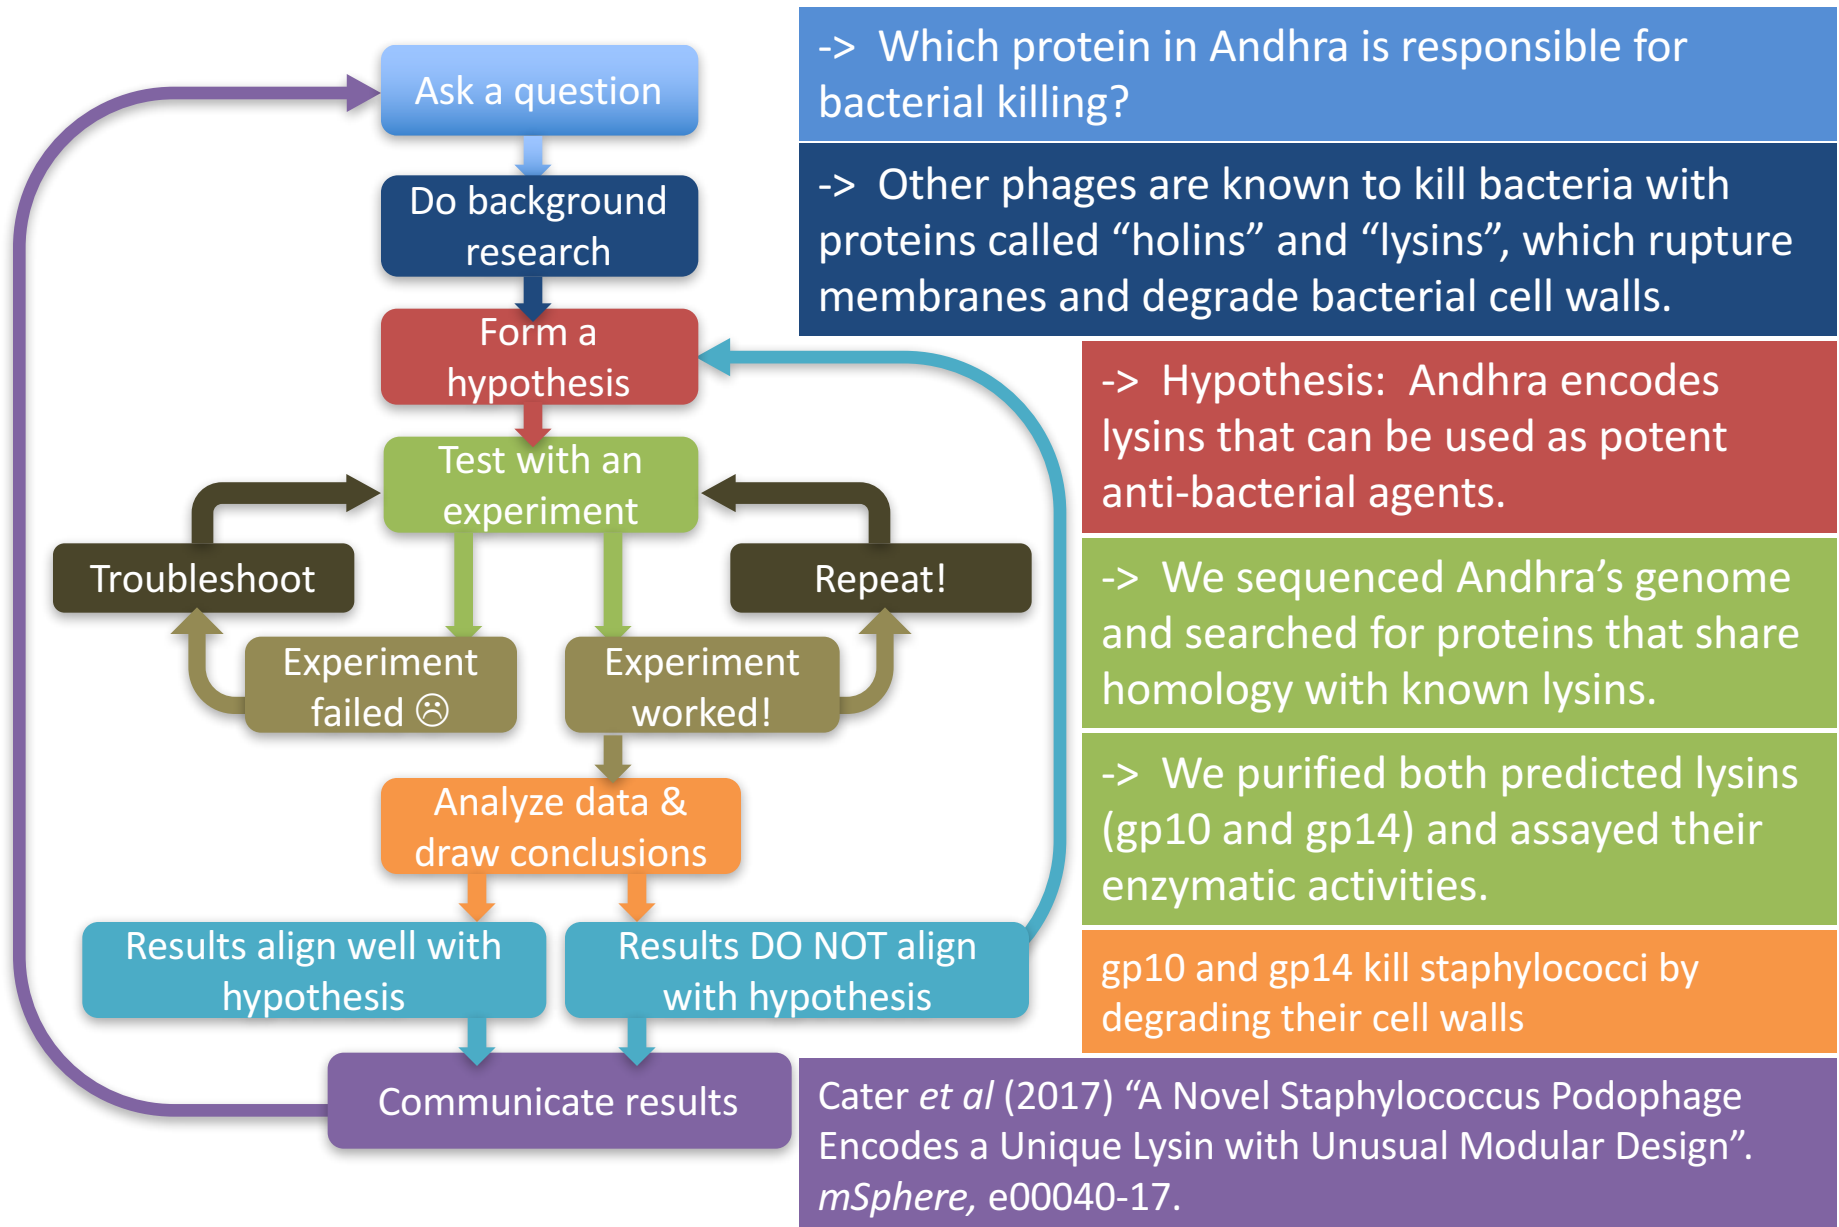

## 3. Effects of purified proteins on cell walls:

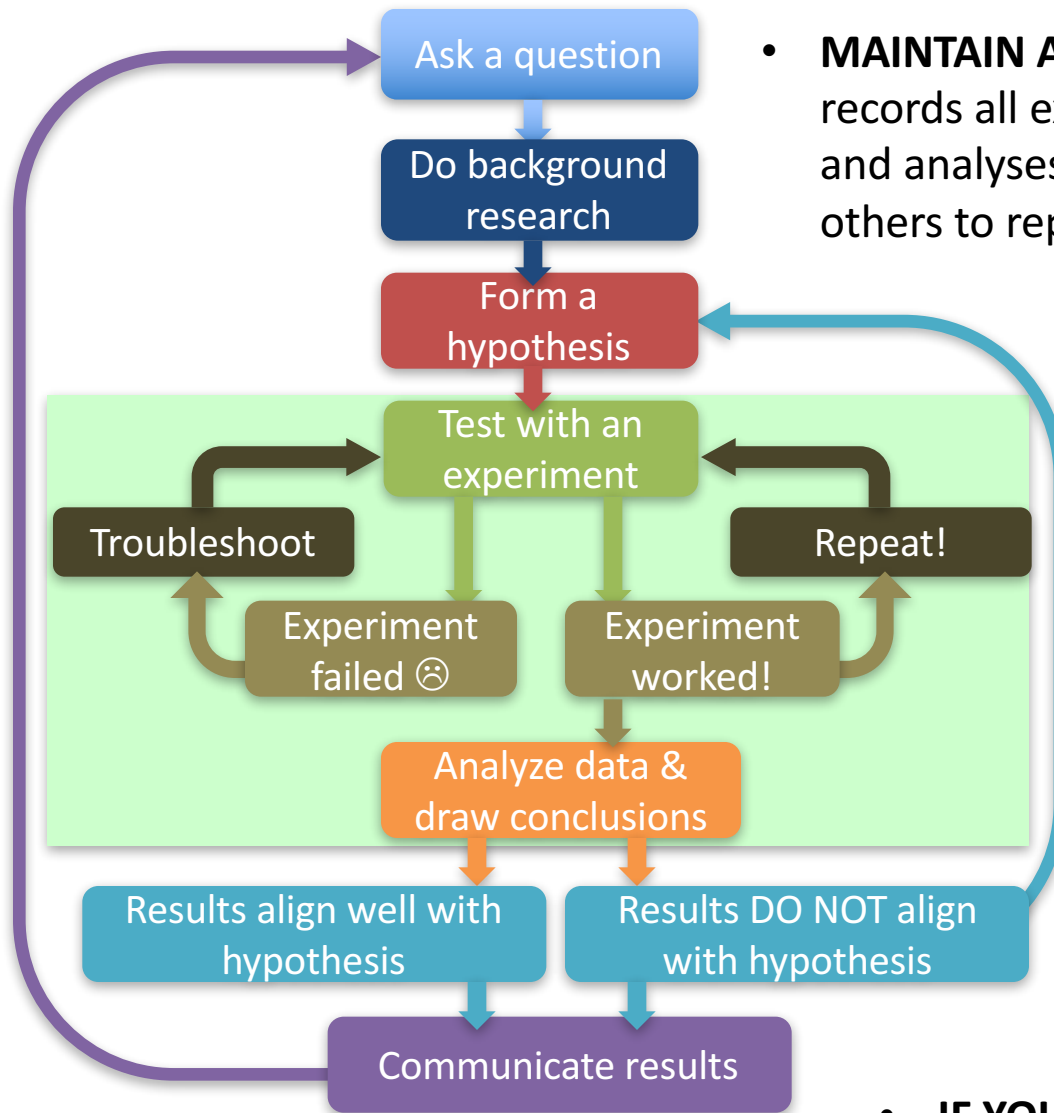

## 2. Effect of purified proteins on cell growth:

# Phage characterization using the scientific method, a series of steps that researchers use to answer questions

# General Lab Responsibilities and Tips

- **SAFETY FIRST!**
- **MAINTAIN A DETAILED LAB NOTEBOOK** that records all experiments conducted, data collected, and analyses in real time! This will allow you and others to reproduce your experiments.
  - **STICK TO THE PROTOCOL.** If changes to the protocol are made, record details in your lab notebook.
  - **RECORD OBSERVATIONS ON A REGULAR BASIS.** Anything that appears out of the ordinary should be faithfully recorded.
  - **RECORD DATA WITHOUT BIAS.** Even if a data point does not appear to agree with the trend, it must be recorded.
  - **WHEN TROUBLESHOOTING, CHANGE ONLY ONE VARIABLE AT A TIME.**
- **IF YOU HAVE ANY QUESTIONS, JUST ASK!**
